Microscopic Description & Histopathological Features

Characteristic Features: Extensive extracellular pools of basophilic or pale mucin containing floating atypical glandular cords, clusters, or signet ring cells.

Clinical Significance: Corresponds to mucinous adenocarcinoma (>50% extracellular mucin component); indicates potential risk of peritoneal dissemination.

Important Diagnostic Disclaimer & Notice:

This report was automatically synthesized by the Gastric Cancer AI Digital Pathology Engine using transfer learning and Grad-CAM explainability algorithms. It is strictly intended as a computerized decision-support and academic research tool. Final pathological diagnosis, staging, and therapeutic interventions require formal microscopic verification and clinical integration by a licensed pathologist and multidisciplinary oncology team.
